

NAIJAGO APP LTD

App Feature Requirements

Developer brief for group ordering, photo reviews, recurring orders and scheduled delivery

Version 1.0 | 19 September 2026

Purpose

This document translates four proposed NaijaGo features into clear product behaviour for design and development. It explains what the customer should experience, the main system rules, important edge cases and the minimum conditions for considering each feature complete.

Recommended release approach

Build the shared foundations first: saved addresses, reliable stock validation, delivery-slot management, notifications and payment-status handling. Then release Scheduled Delivery and Photo Reviews first, followed by Group Ordering, and finally Recurring Orders after payment and inventory behaviour have been proven.

Feature	Customer value	Suggested phase
Scheduled Delivery	Choose a future delivery date and time	Phase 1
Photo Reviews	See real customer photos before buying	Phase 1
Group Ordering	Combine several people's items into one delivery	Phase 2
Recurring Orders	Repeat routine household or business purchases automatically	Phase 3

Product Rules That Apply Across Features

- All prices, stock quantities, vendor availability and delivery fees must be revalidated before payment is completed.
- No order should be confirmed until payment succeeds, unless NaijaGo intentionally supports cash or pay-on-delivery for that order type.
- Dates and times must use the customer's local timezone. For the Abuja launch, display West Africa Time clearly where helpful.
- Customers must receive clear in-app status updates and push notifications for important changes, failures, cancellations and upcoming deliveries.
- The admin dashboard must show the feature type, payment status, vendor status, delivery time and any exceptions requiring support intervention.
- Do not expose private information such as a participant's address, phone number, payment details or full order history to other users.

Key Product Terms

Term	Meaning
Order owner	The person who starts and controls a group order.
Participant	A person invited to add items to a group order.
Delivery destination	The single address where a group order will be delivered.
Order cutoff	The deadline after which participants can no longer edit a group order.
Delivery window	The period selected by the customer for a scheduled delivery.
Recurring order	An order template that repeats on an agreed schedule.

1 Group Ordering

Feature goal Allow several people to add items to one shared cart and receive everything at one delivery destination for one delivery fee.

Customer Example

A wife at home starts an order and chooses the home address as the delivery destination. She sends the group link to her husband while he is at work. He opens the link, adds his preferred items, and submits them to the shared cart. The entire order is delivered to the wife at home, and the husband collects his items when he returns. Participants do not need to be physically together; only the final delivery address must be the same.

Recommended MVP Rules

- One group order must have one order owner, one checkout, one delivery destination and one delivery fee.

- The order owner pays the full order total in the first version. Individual participant payments can be added later because split payments introduce expiry, refund and failed-payment complexity.
- Participants may browse and add items remotely, but they cannot change the delivery address, delivery time, another participant's items or the owner's items.
- The owner sets a cutoff time and may close the group earlier. Checkout starts only after the group is closed.
- A participant may edit or remove their own submitted items until the cutoff. After closing, only the owner may remove unavailable items or cancel checkout.

User Flow

1. The order owner taps Start Group Order from the cart or vendor page.
2. The owner selects the vendor, delivery destination, delivery option and group cutoff time.
3. NaijaGo creates a unique group link and optional join code that can be shared through WhatsApp, SMS or other apps.
4. A participant opens the link. If not signed in, the participant signs in or verifies a phone number before adding items.
5. The participant adds items and taps Submit to Group Order. The system shows the participant's own subtotal but not the owner's private payment information.
6. The owner sees participants, item groups, running subtotal, delivery fee and final estimated total in real time.
7. At the cutoff, or when the owner closes the group, the cart becomes read-only. NaijaGo rechecks stock, prices, vendor hours and the selected delivery option.
8. The owner approves any changes, pays the combined total and receives one order confirmation. Each participant receives a summary of only their submitted items and the delivery destination label approved for sharing.

Screens and Controls

Screen	Required elements
Create group order	Vendor, destination, delivery time, cutoff time, participant limit and Create Link button.
Participant view	Group name, owner's display name, cutoff countdown, product catalogue, own basket and Submit button.
Owner dashboard	Participant list, items by participant, totals, stock warnings, Close Group, Extend Time and Cancel Group.
Final review	Validated items, substitutions or removals, total, one delivery fee, destination, schedule and Pay button.

Important Exceptions

- Expired link: show that the group is closed and prevent additions.
- Out-of-stock or changed-price item: flag the affected item and ask the owner to accept the change or remove it before payment.

- Vendor closes before checkout: offer the next available delivery time or cancellation.
- Owner abandons the order: notify participants that no order was placed; no participant should be charged.
- Duplicate or forwarded link: require login or phone verification, enforce a participant limit and allow the owner to remove an unknown participant.
- Cancellation after payment: apply the normal cancellation and refund policy to the full order. The owner remains the primary refund recipient in the MVP.

Acceptance Criteria

- A user can create a group, share a working link and choose one destination.
- At least two remote participants can add and edit their own items before the cutoff.
- The owner can see the combined cart and is charged only once for the order and once for delivery.
- Participants cannot access other users' private details or change protected order fields.
- The system blocks checkout until stock, price, vendor availability and delivery eligibility are validated.

2 Photo Reviews

Feature goal Let verified customers attach real photos to product reviews so future buyers can judge the item more confidently.

Who Can Post

Only a customer whose order contains the product and has reached Delivered status should receive a Verified Purchase label. NaijaGo may allow unverified reviews later, but verified and unverified content must never look the same.

User Flow

9. From Order History or a review reminder, the customer selects Rate and Review.
10. The customer chooses a star rating, writes optional review text and taps Add Photos.
11. The customer selects photos from the device or takes new photos, previews them, removes unwanted images and submits the review.
12. The app uploads compressed copies, creates thumbnails and shows the review as Pending if moderation is enabled.
13. After automated or manual checks, approved photos appear with the review on the product page.

Recommended Rules

- Allow up to 5 images per review. Accept JPEG, PNG and HEIC, then convert and compress them for web and mobile delivery.
- Set an upload-size limit, for example 10 MB per original image, and generate smaller thumbnails for product pages.
- Strip hidden image metadata, including precise location data, before storage and display.
- Customers may edit or delete their review and photos within a defined period, subject to NaijaGo's moderation policy.
- Provide Report Photo and Report Review controls for customers, vendors and administrators.
- Reject images containing nudity, violence, hate content, personal documents, unrelated advertising, phone numbers or other private information.

- Vendors may reply to a review but must not edit, hide or delete it. Only authorised NaijaGo moderators can remove content for a documented reason.

Display Requirements

- Show photo thumbnails near the top of the reviews section and allow full-screen viewing.
- Offer a Photos Only filter and retain existing sorting such as Most Recent or Most Helpful.
- Show rating, review text, date and Verified Purchase status with the images.
- Use lazy loading and cached thumbnails so product pages remain fast on mobile data.

Admin and Moderation

Admin capability	Expected behaviour
Review queue	Filter pending, approved, rejected and reported photo reviews.
Moderation action	Approve, reject or remove an image and record a reason.
Audit trail	Keep moderator, date, action and reason for each decision.
Customer notice	Tell the customer when a photo is rejected or removed and provide a simple reason.

Acceptance Criteria

- A verified customer can add, preview, submit and later view photos with a review.
- Unsupported, oversized or failed uploads produce a clear error without losing the written review.
- Images are compressed, privacy metadata is removed and thumbnails load efficiently.
- Reported content enters the admin moderation workflow and can be actioned with an audit record.

3 Recurring Orders

Feature goal Allow households, offices and other organisations to repeat routine purchases on a chosen schedule, such as water delivery every Monday.

Customer Example

An office orders ten packs of bottled water every Monday. The administrator creates the order once, chooses the office address and preferred Monday delivery window, selects a payment method and decides whether future orders should be placed automatically or require confirmation.

Recurring Order Setup

Setting	Customer choice
Order name	For example Office Monday Water or Family Weekend Groceries.
Items and quantities	Products, variants and required quantity for each repeat.

Setting	Customer choice
Frequency	Weekly, every two weeks, monthly or a custom interval supported by the system.
Delivery day and window	For example every Monday between 9:00 a.m. and 12:00 p.m.
Start and end	Start date plus optional end date or number of occurrences.
Payment behaviour	Auto-pay with an authorised saved method, or remind customer to approve and pay.
Substitution preference	Do not replace, allow equivalent item, or ask before replacing.

Recommended Order Lifecycle

14. Several days before the next occurrence, the system creates a pending order from the saved template.
15. NaijaGo rechecks product listing, current price, stock, vendor participation, address coverage and delivery-slot capacity.
16. The customer receives an upcoming-order reminder showing the latest total and a deadline to edit, skip or cancel that occurrence.
17. At the processing deadline, the system either charges the authorised payment method or asks the customer to pay, depending on the selected payment behaviour.
18. After successful payment, the occurrence becomes a normal confirmed order and follows the standard fulfilment and tracking process.
19. If payment or validation fails, the occurrence moves to Needs Attention and the customer is notified. The recurring plan remains active unless the customer or admin cancels it.

Customer Controls

- View next delivery date, current estimated total and recurrence status.
- Edit quantities, delivery window, address, substitution preference and payment method for future occurrences.
- Skip one occurrence without cancelling the entire recurring order.
- Pause until a selected date, resume, or cancel permanently.
- Edit only the next order or apply a change to all future orders.

Price, Stock and Payment Rules

- Recurring orders must use the current price at the time each occurrence is processed; never silently promise the original price forever.
- Show an updated estimate in advance. If the total rises above a configurable threshold, require customer approval before charging.
- Card or bank details must be stored and tokenised by the approved payment provider, not directly by NaijaGo.
- If auto-pay is not supported or authorised, the system should create a payment request rather than claiming the order is confirmed.

- After a failed payment, retry only according to an agreed retry policy and notify the customer after each failure. Do not dispatch an unpaid order.
- If an item is unavailable, follow the saved substitution preference. Never substitute a materially different product without approval.

Acceptance Criteria

- A customer can create a recurring plan from a cart or previous order and see the full schedule before saving it.
- The system generates each occurrence at the correct local date and time and validates current commercial conditions.
- The customer can skip, pause, edit or cancel without contacting support.
- Payment failure, price change and unavailable-item flows do not create false confirmed orders.
- The admin dashboard shows the recurring-plan ID and the specific occurrence linked to each order.

4 Scheduled Delivery

Feature goal Allow a customer to place and pay for an order now but choose an available future date and delivery window, similar to scheduling a ride.

How It Differs From Recurring Orders

Scheduled Delivery is for one future order. Recurring Orders repeat automatically or by reminder. A customer can therefore schedule a single birthday delivery for Friday without creating a recurring plan, while an office can use recurring orders for water every Monday.

User Flow

20. At checkout, the customer chooses Deliver Now or Schedule Delivery.
21. If Schedule Delivery is selected, the app displays available dates and delivery windows based on vendor hours, preparation time, rider capacity, product restrictions and the delivery address.
22. The customer selects a window and sees any scheduling fee or price difference before payment.
23. The selected window is temporarily reserved during checkout. The order is confirmed only after successful payment.
24. NaijaGo sends confirmation immediately, a reminder before fulfilment begins and normal tracking updates once pickup starts.

Scheduling Rules

- Use delivery windows rather than promising an exact minute unless operations can reliably meet exact-time delivery.
- Define a minimum lead time, maximum advance-booking period and capacity limit for each window.
- Only show windows that every item and vendor in the cart can fulfil. If that is not possible, ask the customer to split the order.
- Reserve a slot for a short checkout period, then release it if payment is not completed.
- Display the delivery date, time window, destination and rescheduling deadline on the confirmation screen and order details page.
- Allow rescheduling or cancellation before a configurable operational cutoff. After fulfilment begins, normal cancellation rules apply.

- If NaijaGo cannot meet a confirmed window, notify the customer early and offer a new window, cancellation or refund according to policy.

Operational Requirements

Area	Requirement
Vendor	Receive the order early enough to prepare it, with a clear Ready By time.
Rider dispatch	Place the order into the dispatch queue at the correct lead time, not immediately after purchase.
Capacity	Prevent overbooking by area, vendor, time window and available rider capacity.
Notifications	Confirmation, upcoming-delivery reminder, preparation started, rider assigned and delay notice.
Admin	View scheduled orders by date, window, area, vendor and risk status; reschedule with customer notification.

Acceptance Criteria

- The customer sees only valid future windows for the selected address and cart.
- A slot cannot be oversold when two customers attempt to book the last available capacity.
- The order is held for future fulfilment and does not enter rider dispatch too early.
- The customer can view the schedule and reschedule or cancel within the permitted cutoff.
- Vendor, rider, admin and customer views all show the same confirmed delivery window.

Shared Technical Requirements

Component	What is needed
Order model	Fields for order type, group ID, recurring-plan ID, scheduled window, cutoff, owner and occurrence number.
Inventory	Final validation before payment plus clear handling of price or stock changes.
Payments	Idempotent payment requests, verified payment status, refunds and payment-provider tokenisation for authorised recurring charges.
Notifications	Push and in-app events with SMS or email fallback where commercially appropriate.
Background jobs	Reliable scheduled tasks for group cutoffs, recurring generation, reminders, slot releases and dispatch timing.

Component	What is needed
Permissions	Role checks for order owner, participant, verified reviewer, vendor, rider, support and admin.
Analytics	Track feature entry, creation, completion, abandonment, payment failure, rescheduling, skips, photo approval and conversion.
Audit logs	Record important changes to schedules, payments, moderation decisions, participants and recurring plans.

Recommended Analytics Events

Feature	Core events
Group ordering	group_created, invite_opened, participant_joined, items_submitted, group_closed, checkout_completed, group_expired
Photo reviews	review_started, photo_selected, upload_failed, review_submitted, photo_approved, photo_reported
Recurring orders	plan_created, occurrence_generated, occurrence_skipped, plan_paused, payment_failed, occurrence_completed
Scheduled delivery	schedule_selected, slot_reserved, slot_expired, order_rescheduled, scheduled_order_completed, delivery_window_missed

Decisions Required Before Development

Decision	Recommended starting point
Who pays for a group order?	Order owner pays the combined total.
Can a group use multiple vendors?	No for MVP; use one vendor or fulfilment point.
How many group participants?	Start with a configurable limit such as 10 people.
Are photo reviews pre-moderated?	Use automated screening plus a report queue; manually review flagged content.
How many review photos?	Maximum 5 per review.
Recurring payment model?	Offer reminder-to-pay first; enable auto-pay only after provider tokenisation and consent are confirmed.

Decision	Recommended starting point
Price-change approval threshold?	Make it configurable by percentage or amount.
Scheduled delivery precision?	Use capacity-controlled delivery windows, not exact-time promises.
Maximum advance booking?	Make it configurable by city, vendor and product category.

Suggested Delivery Sequence

25. Foundation: saved addresses, delivery windows, notification service, stock validation and reliable payment states.
26. Release 1: Scheduled Delivery and Photo Reviews.
27. Release 2: Group Ordering with one owner payment, one vendor and one destination.
28. Release 3: Recurring Orders with reminder-to-pay; add authorised auto-pay after operational testing.
29. Optimisation: participant payments, multi-vendor consolidation, smarter substitutions and business account controls.

Definition of Done

A feature is ready for public release only after its customer flow, operational handling, payment failures, notifications, analytics and acceptance criteria have been tested. Customer terms must also cover cancellations, refunds, recurring charges, moderation and missed delivery windows.
